Only BS6, CNG, or EV commercial vehicles in Delhi from November 1

In a decisive move to combat air pollution, Delhi Chief Minister Rekha Gupta has announced the Air Pollution Mitigation Plan 2025, a strategy targeting vehicular emissions, dust and solid waste while advancing green mobility and infrastructure. A key highlight is the restriction on non-compliant commercial vehicles entering Delhi from November 1, 2025. Only BS-VI, CNG or electric commercial vehicles will be allowed to run. The city will also revise its EV policy, aiming to transition 80 per cent of government fleets to clean fuels. Sensitive ecological zones will be reserved exclusively for EVs, with gradual removal of non-electric vehicles. To enforce this, Automatic Number Plate Recognition (ANPR) cameras will be installed at borders and fuel stations to detect End-of-Life (EoL) vehicles.

ALL TWO-WHEELERS TO GET ABS AS STANDARD FEATURE

In a major push to improve road safety, the Ministry of Road Transport and Highways (MoRTH) has announced that starting January 1, 2026, all new two-wheelers sold in India, regardless of engine size, must be equipped with Anti-lock Braking Systems (ABS). Additionally, dealerships must provide two BIS-certified helmets with each vehicle, ensuring protection for both the rider and pillion. Currently, ABS is only mandatory for models above 125 cc. The new rule extends this crucial safety feature to all segments, including budget scooters and motorcycles. ABS helps prevent wheel lock-up during sudden braking, reducing the chances of skidding and improving vehicle control, especially in emergency situations. This regulation may lead to a slight price hike in the 100-125 cc segment—the most popular in India—due to the added safety hardware like front disc brakes and ABS units.
