was taken from the World Bank Sima database; it was taken up until July 15, 2003 (Fig. 4.1).

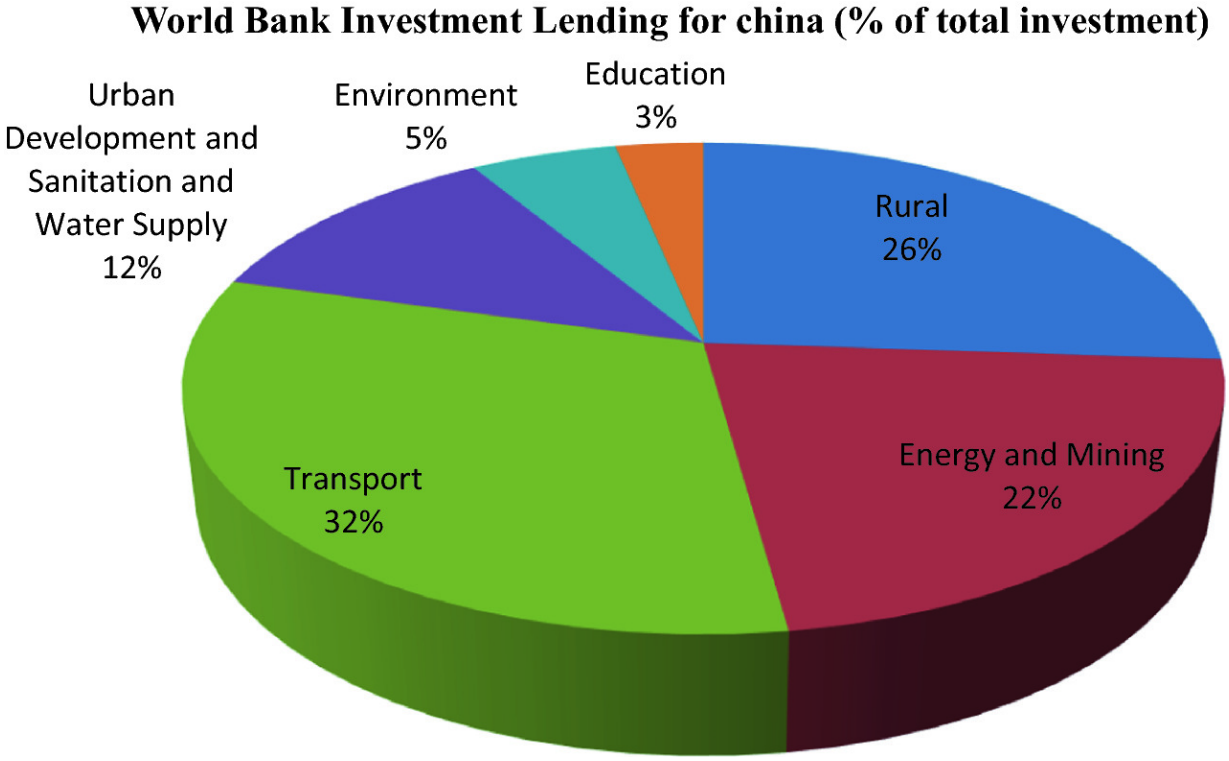

Fig. 4.1 World Bank lending to China for investment on multiple sectors (in percent) (*Source* The World Bank Simadatabase, data was taken till July 15, 2003 [World Bank, "Data and Statistics 2003", 2003, http://www.worldbank.org/data/datatopic/GDP_PPP.pdf])

Out of the grant, China allocated 3 percent to the education sector, 26 percent to rural development, 22 percent to energy and mining, 32 percent to transport, 12 percent to urban development and sanitation and water supply, and 5 percent to the environment sector.

The above trend helped China to register sound economic development. Scholar Xiaodong (2012)[5] has elaborated a comprehensive picture of China's economic structure from 1952 onwards, China's per capita GDP growth, and the labor participation rate. Xiaodong analyzed the capital/output ratio, the average human capital, and the total factor productivity. The author made these calculations based on the reports of the Penn World Table (PWT7.0) (Table 4.3).

Table 4.3 Deconstructing China's growth: 1950–2007

The average annual growth rate					
Period	GDP per capita	Labor participation	Capital/output	Average human	TFP
