Arrangement (CRA) (Alam Iqbal 2021). The institution's objective is to aid infrastructure and sustainable development projects in BRICS member countries. The BRICS is actively taking positions on various international issues. With this trend in international relations, the global order is being transformed into Multipolarity politics in emerging international relations. Another critical aspect of the BRICS is that it can bring stability and normality to the global order and regional politics despite fractures within the BRICS group.

Questioning Bipolarity

The concept of polarity has been prevalent in the political thinking of international relations since the history of humankind, be it in the *Peloponnesian* by Thucydides,[1] in the hegemonic politics between Rome and Carthago, or in some pre-modern times, like in Sumerian, Chinese, Indic, Greek, Maya, and Italian civilizations (Kegley and Raymond 1994). The earliest and most famous traces of multipolarity was in the nineteenth-century Concert of Europe,[2] established after the defeat of Napoleon (Kratochvil 2002). However, the international system was described theoretically by Hans Morgenthau as late as in the twentieth century, whose study was based on the beginnings of the Cold War, postulating that bipolarity was the most stable international order. Morgenthau, in his book *Politics among Nations,* said that:

> The changed structure of the balance of Power has made the hostile opposition of two gigantic blocs possible, but not inevitable. Quite the contrary, the new balance of Power is a mechanism that contains the potentialities for unheard-of good and unprecedented evil. Which of these potentialities will be realized depends not on the mechanics of power balance, but on moral and material forces which use that mechanism for the realization of their ends. (Morgenthau 1948: 289)

Later, a prominent neo-realist scholar, Kenneth Waltz, elevated the concept of such polarity to the systemic level in 1979. He said that structures were defined by identifying a principle within the respective system, and further, by the specification of its system units. Next, they further illustrated the distribution of capabilities across units (Waltz 1979: 100–101). Waltz explained that the international system always remained anarchic, as its main components were nation-states, which are considered 'units' within that global system. Then, it is clear that the only changing feature of the international system is the capabilities of these nation-states. So, the neo-realists argued that bipolarity was more stable than the multipolar system. Given the context of the time they were writing in, there
