Source Angus Maddison in OECD (2001), 'The World Economy: A Millennial Perspective,' p. 127

Table 2.1 explains how great power regions and countries have performed in their respective economic growth charters to emerge as power regions. Western Europe indeed was the most dominant in the history of international relations. It started registering an impressive growth rate from 1000 AD onwards due to multiple reasons, including the industrial revolution. According to the above data, Angus Maddison explained that Western Europe registered 0.30 percent in its global GDP from 1000 through 1500 AD. During the same period, the Western Offshoot countries registered 0.07 percent. Japan 0.18 percent, other Asian countries put together (excluding Japan) was 0.13, Latin America was 0.09 percent, Eastern Europe and former USSR was 0.20 percent, Africa was 0.06 percent, and the rest of the world growth rate was 0.15 only.

Further, Western Europe's growth only accelerated following 1500–1820 AD at 0.41 percent. The Western offshoot countries registered 0.78 percent growth, while Japan was 0.31 percent. The rest of Asia (excluding Japan) was at 0.29 percent, Latin America was at 0.21 percent, Eastern Europe and former USSR was at 0.44 percent, Africa at 0.16, and the rest of the world registered at 0.32 percent. Western Europe during the period of 1820–1870 was 1.65 percent. The period of 1870–1913 registered 2.10 percent, the period between 1913 and 1950 was 1.19 percent, while from 1950 to 1970 it was 4.81 percent, and between 1973 and 1998 it was 2.11 percent. The above data clearly stated that whatever regions and countries dominated, they registered impressive growth rates during their heyday. Likewise, military spending also plays a crucial role in determining the country's domination in world affairs. Table 2.2 diligently explains how the two phenomena share a symbiotic relationship and are dependent on each other.

Table 2.2 The Military spending of the great powers in peacetime 1870–1913 and 1920–1938
