Aleksei Arbatov (2013) argued, 'In the foreseeable future, contrary to what was seen in the later twentieth century, nuclear weapons will lose their function as a status symbol and as a basic guarantee of the leading powers' security.'

The growing interdependence in this century has helped the world from abstaining from war over little reasons; instead, they cooperate and share their concern equally. It could probably be solved through negotiations, consultation through emissaries, or diplomacy if this is not the case. For instance, conflict in the Korean Peninsula,[8] and the Iran nuclear imbroglio,[9] in which negotiations have taken place at regular intervals. In addition to that, the Russia–China territorial conflict, the frequent India–China skirmishes along the border, and the UK and Argentina's dispute over Falkland Island, China–Japan over the Kuril island issue, the India–US trade disputes, and the ongoing Arab and Ukrainian crisis are quintessential examples for the modern world's political instability and cross-cutting issues.

During the visit to Russia in 2013 on March 23, the Chinese president Xi Jinping[10] at the Moscow State University spoke about a multipolar world. He stated that peace, development, cooperation, and mutual benefit are prominent features in international relations. After colonialism and the Cold War, no country or group could dominate present-day world affairs single-handedly. No country can live thinking about the fuddy-duddy or zero-sum mentality of the Cold War period. And he said that an international balance of power continues to evolve toward peace and development in the world.

Multipolarity, A Theoretical Underpinning

The tabular explanation of the multipolar world's theoretical basis can be built as drawn in Table 2.8. Table 2.8 describes how different theories position the concept of multipolar world order in international relations. Below is a tabular explanation of the multipolar world's theoretical basis. Table 2.8 describes how different theories position themselves on the concept of multipolarity in international relations. Some of the examples of the influential groupings in IR theory dealing with multipolarity.

Table 2.8 Estimated foresight on polarity

School of thought	(Neo)realist-declinists, e.g., Waltz	(Neo)realists hegemonists, e.g., Wohlforth	Neoliberals, e.g., Lebow, Kegley, etc
What is the relevance of system polarity?	Very important	Very important	Some relevance
