South Africa in the group, other members of the BRICS have a lot of scope for science and technology development. However, BRICS group members have to invest in this sector. But, China's R&D is three times higher than the combined expenditures of all other BRICS countries. For instance, in 2014, China reached 496.0 bln USD (PPP) in 2017, whereas the United States (the world's R&D expenditure) was 543.2 bln USD in 2017. China's R&D has been steadily increasing for the last 15 years, while other BRICS countries have remained essentially unchanged. Therefore, the BRICS group countries have to look into it. According to the NDB members, they currently represent 42 percent of the world's total population and 20 percent of the global GDP, according to NDB members, which is not reflected in their voting power in the international monetary system. Notably, the NDB members oppose the informal arrangement that historically has been in place, as the World Bank presidency is always is from the United States and the IMF's leadership is always is from Europe. And there is no significant change in the voting power despite continued demand for reforming them. It is said that even after the recent reforms, the BRICS holds 13.68 percent of the World Bank's voting shares and 14.7 percent of the IMF's (Hooijmaaijers 2019).

Whatever may be the reason, the BRICS group with solid economic growth, the most substantial commonality between the members is that all the BRICS member's governments explicit desire to acquire higher social status in international relations (Roren and Beaumont 2019: 429). Scholar Jim O Neill (2021) says that the actual growth rate of the world may not reach 4 percent surpassing the past two decades 3.7 percent of them could also be challenging. However, four factors will determine whether we get the growth required by the world. They are productivity in developed economies, how quickly China's growth trend slows, the success of India, and whether the other highly populated emerging market economies like Indonesia, Mexico, Nigeria, and Vietnam emerge. Apart from that,

In the aftermath of COVID-19, emerging market economies, especially the larger ones, must adopt intelligent fiscal policies that prioritize public investment. We need a different basis for assessing budgetary policy's fundamental economic framework and circumstances. Specifically, the time has come to distinguish between government investment spending and consumer spending; the former is likely to have a positive multiplier effect and should not be treated from an accounting perspective the same as government expenditures on consumption. Tackling climate change and future health threats requires such investments. Emerging market economies' achievement of their growth potential depends on such investment, arguably more critical for economic growth than financial conditions.[20]
