The restructured policies created fruitful results. The circumstances that prevailed in international relations also led to the Russian revival. Scholars like Rumer and Wallander (2003) said that Russia's economy improved from 4.3 percent in 2001 to 7.1 percent in 2003. Its currency became very stable as it started re-paying international debts, and the population began receiving pensions and wages regularly. Russia also runs its economic surpluses. Inflation brought down marginally, and Russia's central bank holds a foreign currency of more than 64$ billion. Later, Putin acknowledged several economic sectors' value to uplift the shattered economy and affirmed the importance of oil and natural gases and natural resources. Further, Russia became one of the world's largest oil and natural gas producers. It stood in third and second positions in gas production. With this trend, Russia made huge profits, Russia's economy improved, and Russia became one of the stakeholders in the world's oil and natural gas production (ibid.).

Further, since 2000, Russia's GDP has gone up to 70 percent, its industrial growth has been 75 percent, and its investments have increased by 125 percent. With this, Russia has become part of the top ten countries in the global economy again. Russia has become a super energy power, with a government-controlled oil and gas sector. With the state control of oil and gas companies, investors have become very open and transparent, for example, with companies like Gazprom and Rosneft (Sputnik International 2008). The Stabilization Fund was established in 2004 to manage oil and gas revenues. Within a year, oil profits accumulated to 500 billion rubles, which is equal to US$18 billion. After two years, Russia repaid all its Soviet Union debts. And deduction of the Stabilization Fund helped reduce the inflation pressure on its economy. With an exceeding amount of profits accumulated under the Stabilization Fund, Russia could finally divert its profits to other development institutions (ibid.).

Industrial production increased. The 1998 economic crisis benefited Russia, with its industrial development growing. According to the Russian federal statistics service, the industrial growth rate was 11.9 percent in 2000 (Sputnik International 2008). However, within two years, it got reduced by 3.7 percent. But, a new rise soon began again, and industrial growth reached 6.3 percent in 2007. Personal income increased during this period because the average wage increased from 2200 rubles (US$90) to 12,500 rubles ($500) over eight years. Poverty also reduced from 30 to 14 percent
