Diagnosing the Future: Dr. Jasjit S. Suri and the Algorithm That Is Saving Hearts Across the World

When a garage startup funded by ten paisa produces 50 patents, 400 research papers, and a cardiovascular AI platform deployed across six continents, the story stops being a biography and starts being a reckoning with what Indian scientific ambition can achieve.

DR. JASJIT S. SURI
Chairman and CEO of AtheroPoint™

Dr. Jasjit S. Suri did not set out to build a company. He set out to answer a question that was killing people: why do patients learn they have cardiovascular disease only after their first heart attack? At IBM, Siemens, and Philips, he had spent years building the engineering foundations that would eventually power his answer. In 2004, from a garage in Roseville, California—funded, as he has said, with little more than conviction—he founded AtheroPoint.

The company's flagship product, AtheroEdge, is the world's first fully automated AI diagnostic tool for early atherosclerosis detection. FDA-cleared, clinically validated, and deployed across the United States, India, Tanzania, Rwanda, Slovenia, and the Philippines, it measures carotid intima-media thickness with a precision and speed that human diagnostic workflows cannot match.

The scientific credentials behind AtheroEdge are singular. Dr. Suri ranks in the top 2% of scientists worldwide, holds an H-index exceeding 100, and has over 56,000 citations—making him the only CTO-entrepreneur globally to have crossed that threshold. He has co-authored more than 100 books on AI and medical devices; received Lifetime Achievement Awards in both the United States and India; and holds fellowships in IEEE, AIMBE, and the Society of Vascular Medicine.

At the heart of his work is the P3 framework: Preventive, Precision, and Personalized care—an anytime-anywhere model designed to bring cardiovascular diagnostics to every patient, regardless of geography or income.

"Our goal is to make precision cardiovascular care accessible to every patient, regardless of where they live," says Dr. Suri. "The gold standard for diagnosis is always human—this is merely a tool to save time, and perhaps a life."

For a generation of patients who will never visit a specialist, that tool may be the most important doctor they ever encounter.

Trust in Transit: How Dr. Vinod Anand Built India's Most Credible Healthcare Logistics Institution — One Shipment at a Time

In a country where an MRI machine delay is a diagnosis delay, and a delayed diagnosis can cost a life, the logistics of healthcare is not a support function—it is a frontline responsibility.

DR. VINOD ANAND
Managing Director of Akanksha Global Logistics Pvt. Ltd.

Dr. Vinod Anand understood this before most in the industry did. Armed with a background in biology, a nationalized bank's discipline, and a license as a custom house agent since 1985, he founded Akanksha Global Logistics Pvt. Ltd. in 1987 with ₹80,000 in capital at a time when customs clearance was manual, opaque, and deeply susceptible to the kind of delay that costs not just money but lives.

Thirty-eight years later, AGL has a turnover of ₹300 crore, a pan-India footprint spanning Delhi-NCR, Mumbai, Gujarat, Kolkata, Bihar, Odisha, and Punjab, and a client roster that reads like a directory of India's most trusted healthcare institutions: Medanta, Apollo Hospitals, BLK Hospital, Max Hospitals, Fortis, and Dr. Lal PathLabs. These are not clients who choose a logistics partner on price. They choose reliability—the certainty that a surgical robot ordered from Germany or a diagnostic device cleared from the United States arrives precisely when and in precisely the condition the hospital requires it.

ISO 9001:2008 certified and ACAAI accredited, AGL has evolved from transactional customs clearance to strategic advisory—guiding clients through regulatory pathways, digital customs frameworks, and risk mitigation in one of the world's most complex import environments.

In a sector increasingly vital to India's medical tourism economy, where foreign patients arrive expecting global clinical standards, the supply chain behind those standards is AGL's quiet contribution to the country's healthcare reputation.

"Logistics is a responsibility," Dr. Anand has said. "In healthcare, the line between a shipment and a patient outcome is shorter than most people realize."

It is a principle he has built four decades of institutional trust upon.
