

DR. GAYANI RAJASEKHAR

REINVENTING SUCCESS, ONE LIFE AT A TIME

Some careers are built on a single calling. Dr gayani rajasekhar's life has been defined by the courage to answer many. A doctor, educator, psychologist and an institution builder., she has continually reinvented herself—not in pursuit of titles, but in response to purpose. Her journey reflects an enduring belief that true success lives in creating meaningful change in the lives of others.

Her academic credentials reveal an extraordinary commitment to learning. After earning an MBBS from Ballari Medical College, she specialized in Anesthesiology from ST. john's Medical College ,Bengaluru and spend nearly two decades in medical practice. Yet one reoccurring experience transformed her professional trajectory. She kept encountering children with learning disabilities who feigned illness to avoid school. A pattern that kept unsettled her enough to pick a book on dyslexia and that curiosity became a Master's in Psychology ,specializing in child behavior and development along with a Cambridge International Diploma for trainers and teachers---- opening the door for new mission in Education.

Growing up as eldest daughter, Gayani credits much of her resilience to her father, who encouraged her to challenge convention and realise her potential. The years that followed weren't smooth. Marriage, motherhood and profession demanded a different kind of strength. Influenced by her mother in law, an educationist herself , gayani made her conscious decision to balance family and medicine stating that womanhood is not proving strength but discovering it. Her growing interest in psychology eventually led her into school leadership, where she found a larger canvas for impact. That redirection came with its own isolation. Moving from the research-driven , high intensity world of medical care into a gentler, slow rhythm of school administration left her, in her own words , without a professional community for a while , “I see a big challenge was I had no friends.” Alongside her husband , an engineer equally passionate about education , she helped build an institution committed to making international quality education accessible to middle class families. Their vision extended beyond academic excellence to inclusive education eventually synthesising all to knowledge renewal.

Even today, at 56,Age is not a decline; it is a deeper version of wisdom and Gayani continues to evolve. Her current research interests lie in behavioural neuroscience and varied childhood .She dislikes the universal construction of framing children as good performers and nonperformers as there are lived experiences in every home so much to say that even twins are different .

While her educational philosophy increasingly focuses on experiential learning and skill development. Inspired by India's rich craft traditions, she hopes to expose children to indigenous art forms that foster creativity, appreciation and self-reliance.

Her commitment to shaping future generations also extends to gender sensitisation. Through structured discussions on equality beginning in middle school and initiatives such as dedicated "Mother's Meets," she seeks to strengthen the role families play in raising empathetic, respectful young adults.

For Gayani, it isn't a headline or a title that define a woman's success and can never been measured by recognition or professional milestones. She believes every woman carry a profound responsibility not merely to achieve personal success but to shape the future generation . Real achievement, she says, comes from using one's abilities to improve the lives of others.

Looking back, she considers her greatest accomplishments not only the transition from medicine to education, but also raising her four children committed to serving society. In a world that often celebrates linear careers, Dr. Gayani Rajasekhar's story is a reminder that purpose can evolve, reinvention is a strength, and leadership is ultimately defined by the lives one transforms.
