

PRECISION SUSPENDED

IWC Schaffhausen

Ingenieur Tourbillon 41

The Ingenieur finally gets a tourbillon worthy of its industrial good looks. IWC's automatic caliber 82905 pairs a ceramic-component Pellaton winding system with an 80-hour reserve, then makes the delicate bit genuinely usable: the flying tourbillon can be stopped for second-accurate setting. Diamond Shell coating on the escape wheel and pallet lever reduces friction, while the 56-part cage weighs just 0.635 grams. Suspended at six beneath gold-coated bridges, it adds kinetic tension to the olive Grid dial. A full-gold integrated sports watch was never going to whisper, but its cleverest flex is hiding inside.

GLOBAL ORBIT

Louis Vuitton

Escale Worldtime Flying Tourbillon

Louis Vuitton has placed the tourbillon exactly where its monogram wants to be: centre stage. The automatic caliber LFT VO05.01 fits a central, flower-shaped flying tourbillon into the same space as a rotating city disc, while jumping hours, minutes and day-night indications track 24 zones. Around it, 25 colours of grand feu enamel require 80 hours of work. It is a worldtimer constructed like a couture complication, with a 62-hour reserve and no interest in travelling anonymously.
