Black Bay 58, 2026 Update

Tudor's updated Black Bay 58 proves toughness need not arrive in an oversized case. At 39 mm by 11.7 mm, the steel diver still delivers 200-metre water resistance, a screw-down crown and a newly toothier timing bezel. Calibre MT5400-U provides 65 hours of reserve and METAS-certified resistance to 15,000-gauss magnetic fields. The T-Fit clasp adds instant micro-adjustment. Vintage black-and-gilt styling disguises a thoroughly modern tool watch.

ORBITAL ARMOUR

IWC

Pilot's Watch Venturer Vertical Drive

IWC designed the Venturer around gloves, g-force and vacuum rather than an airline cockpit. Its ceramic and Ceratanium case survived repeated 10g directional changes, vibration trials and pressure testing, while the low-off-gassing fluoroelastomer strap is suited to confined spacecraft. The Vertical Drive system replaces the crown with a rotating bezel for winding, time setting and independent hour adjustment, selected by a side rocker. Calibre 32722 supplies a second time zone and five-day reserve. It is mechanical overengineering aimed squarely beyond Earth.
