TIDAL ACCURACY

Grand Seiko

Spring Drive U.F.A. Ushio 300 Diver SLGB023 and SLGB025

Grand Seiko finally gives extreme precision a suitably tough shell. The Ushio 300's 40.8 mm case and bracelet use High-Intensity Titanium, roughly 30 per cent lighter than steel, yet retains the bright finish expected from the manufacture. Its screw-down crown, luminous bezel and 300-metre rating establish proper diving credentials. Inside, Spring Drive calibre 9RB1 is accurate to an extraordinary ±20 seconds per year and runs for 72 hours. A locking extension clasp with micro-adjustment completes Grand Seiko's smallest, and arguably most convincing, professional diver.

TESTED PRECISION

Omega

Constellation Observatory Collection

Omega hides laboratory-grade resilience beneath a distinctly vintage exterior. The O-MEGASTEEL case surrounds calibre 8914, powering the first two-hand watch to earn Master Chronometer certification. The completed timepiece is monitored continuously for 25 days and tested for accuracy, power reserve, water resistance and exposure to magnetic fields reaching 15,000 gauss. Twin barrels provide 60 hours of autonomy, while the independently adjustable hour hand simplifies travel. The pie-pan dial and dog-leg lugs look genteel, but its technical constitution is considerably tougher than its tailoring suggests.
