POWER NAP

Vacheron Constantin

Traditionnelle Twin Beat Perpetual Calendar

Vacheron Constantin solves the perpetual calendar's most annoying problem: what happens when a collector stops wearing it. Calibre 3610 QP offers two regulators, a 5Hz Active mode with four days of reserve and a 1.2Hz Standby mode stretching autonomy to 70 days. Press the case pusher and a V-shaped spring stops one balance while releasing the other, with differentials keeping the display continuous. Better still, the energy-efficient calendar changes all its indications instantaneously at midnight. This is not merely an extended power reserve. It is mechanical hibernation with impeccable manners.

SHAPED INFINITY

Patek Philippe

Cubitus Perpetual Calendar Ref. 5840P-001

The Cubitus finally has a complication equal to its controversial silhouette. Patek Philippe's first Grand Complication for the collection places a perpetual calendar inside a square, skeletonised calibre shaped to echo the platinum case. The micro-rotor-driven 28-28 Q SQU tracks the day, date, month, leap year, 24-hour time and moon phase, requiring no calendar correction until 2100. Its oversized single-moon display is particularly compelling, completing one rotation per lunar cycle instead of relying on the customary twin moons. Laser-cut blue dial strips expose the machinery without surrendering legibility. Whether one loves the Cubitus or loathes it, this is the version that makes the most convincing argument for its existence.
