

CARTIER

Privé Crash Skeleton in Platinum

Melting Mechanics

Most skeleton watches reveal a movement. Cartier forces the movement to become the watch. The manually wound calibre 1967 MC is shaped to fill the Crash's impossible platinum outline, with its bridges doubling as distorted Roman numerals and its remaining structure hand-hammered on both sides. There is no conventional dial to tidy things up, just blued hands floating above wonderfully warped mechanics. A ruby cabochon and burgundy strap add colour to the 150-piece edition. It is less a skeleton watch than a piece of functional Surrealism.

HERMÈS

H08 Squelette

Geometric Exposure

Hermès treats skeletonisation as industrial design rather than decorative surgery. The black DLC titanium case and ceramic bezel frame calibre H1978 S, conceived from the outset to follow the H08's rounded-square silhouette. An X-shaped structure supports the visible gear train, while a matching open-worked rotor completes the geometry from behind. Floating blue numerals, luminous hands and a Zanzibar blue rubber strap prevent the monochrome mechanics from feeling severe. With automatic winding, a 60-hour reserve and 100-metre water resistance, this skeleton expects to leave the display cabinet.
