The Volumetric Vent

Built amidst a serene landscape in rural Bangalore, House by the Grove by Taliesyn champions passive design and green architecture. Rather than relying on energy-heavy mechanical systems, the home intuitively responds to its environment through intelligent spatial planning and a climate-conscious material palette. The structure is thoughtfully divided into two blocks at varying heights, a technique that creates a gradual transition of volumes to prevent heat build-up while actively encouraging continuous air movement. Columned living spaces form porous edges that invite cross-ventilation and diffuse natural light. At the entrance, a strategically placed water body provides natural evaporative cooling, working in tandem with multiple openings to ensure a constant breeze throughout the home.

BALANCED SANCTUARY
House by the Grove by Taliesyn is a place of balance between openness and privacy, light and shade, built form and landscape
