

The material choices deeply reinforce this sustainable ethos while adding a rich, tactile character to the interiors. A high-pitched Mangalore-tiled roof plays a critical role in thermal regulation. Underfoot, thermally stable materials like Kota stone, Sira stone and clay-tiled flooring leverage their natural thermal mass to maintain cooler indoor conditions. This is complemented by hand-finished cement walls that further minimise heat absorption while giving the home an earthy, breathable quality. By seamlessly weaving together porous planning, native materials and the microclimate of the surrounding pre-existing grove, this home remains naturally cool and comfortable.
