

ALL OUT's Saath Ladenge Dengue Se

campaign to counter the dengue menace

As India prepares for another dengue season, ALL OUT's Saath Ladenge Dengue Se serves as a timely reminder that there is an urgent need at the national level to drive discussions on Dengue, create awareness and take actions to counter its rise.

Dengue fever, a mosquito-borne viral disease transmitted primarily by Aedes aegypti, has emerged as one of the most significant public health challenges worldwide.

Over the past few decades, the global incidence of dengue has increased dramatically, with an estimated 390 million infections occurring annually. Before 1970, only nine countries had experienced severe dengue epidemics. Now, dengue is found in 129 countries with Asia accounting for roughly 70% of the total global burden of this disease.

Of late, India has become a major global epicentre for dengue with studies estimating around 33 million clinical cases occurring annually - that's nearly one-third (33%) of the dengue disease burden.

Also known as 'breakbone fever' because of the severe pain it can cause, dengue once limited to specific cities is now endemic in almost all Indian states with periodic epidemic outbreaks causing substantial morbidity and mortality. Children, particularly those under the age of five, are at greater risk of severe dengue illness. It's also possible for pregnant women with dengue to pass it to their babies during pregnancy or around the time of birth.

DENGUE FEVER

Knows the Signs. Act Early

Signs & symptoms of DENGUE FEVER	Severe Symptoms MIGHT INCLUDE
Abrupt onset of high fever	Frequent vomiting with or without blood
