

The Rise of the Breathable Home

Beyond air circulation, Orient Electric's Aero O2 uses Plasma ION technology to help improve the quality of indoor air

Bureau Report

We spend so much time getting our homes to look right, the furniture, the lighting, the finishing touches. But increasingly, the way a home feels is being shaped by something less visible, the quality of the air inside it.

Spend enough time in a sealed, air-conditioned room and you begin to notice it. A subtle heaviness. A low-energy afternoon that no coffee quite fixes. Often described as indoor fatigue, it has quietly become part of everyday urban life, in Mumbai, Bangalore, Delhi, in any apartment where the windows stay shut and the AC runs all day.

That's the gap the Aero O2 from Orient Electric is designed to address. Positioned as India's first oxygen-enriching fan, it goes beyond simply circulating air. At its core is a patented Bio-Oxy Plasma ION+ Technology that releases active ions into the room, interacting with harmful pollutants, airborne microbes, and toxic gases to break them down while releasing oxygen back into the environment. The result is air that feels fresher, cleaner, and more breathable over time. Designed to actively work on indoor air quality, the system helps reduce toxic gases, neutralise microbes, and supports the restoration of oxygen levels up to 90 per cent, creating a more revitalised living environment for modern homes.

And it belongs in a beautiful home. Sleek and well-proportioned, with aerodynamic blades that deliver powerful, whisper-quiet airflow, it integrates seamlessly into contemporary interiors. A point-anywhere remote keeps things effortless, while a reverse rotation mode and independently operating Plasma Ion module ensure it remains useful across seasons.

The best homes today do more than impress, they restore. The Aero O2 is a quiet but meaningful step in that direction, reminding us that truly good living isn't just about what we see, but about how a space feels.
