

Volume Over Footprint

The project began while the residential apartment development was still under construction, presenting us with a rare opportunity. The clients were given a choice between connected horizontal apartments or a duplex configuration. We immediately guided them toward the duplex, not for extra square footage, but for its spatial possibilities. The gift of height and volume allowed us to break away from standard apartment templates and make the space feel house-like. Because the structural shell was incomplete, we were able to completely rework the internal planning from scratch.

Equal Space for Every Member

The design brief was deeply practical. Instead of the typical hierarchy of a grand master suite paired with smaller secondary bedrooms, the home has three primary family bedrooms and one guest bedroom. We designed independent sanctuaries for the parents and their two daughters, ensuring each room was accompanied by a spacious bathroom and extensive wardrobe areas. Governed by the parameters of Vaastu and structural realities, we chose openness as our primary design tool, dividing the layout into public and private zones connected by a sweeping central volume.
