COLOUR MEETS LIGHT
Patterned screen filters natural light in the living space; sculptural forms and playful colour come together in the dining (below)

In the heart of Kharvel Nagar, one of Bhubaneswar's most upscale neighbourhoods, we were tasked with designing a 2,200 sq ft residence that redefines contemporary urban living. Envisioned as a calm, minimal retreat for a couple and their daughter, our goal was to prioritise sensory experience over visual excess. Built within an existing G+2 structure hemmed in by neighbouring buildings, the project presented severe constraints regarding natural light and ventilation. Rather than viewing these limitations as barriers, we turned them into architectural opportunities, crafting a serene, airy, and deeply personal sanctuary that elevates the everyday experience of living.

Embracing Imperfection

The core concept of the residence draws heavily on Japandi design and the philosophy of Wabi-Sabi, an approach that celebrates imperfection, authenticity, natural textures and asymmetry. Moving away from glossy finishes and trend-driven aesthetics, our clients sought a meaningful environment where every detail feels organic and emotionally resonant. We interpreted this through imperfect textures, raw materials, handcrafted detailing and intentionally asymmetrical compositions that make the spaces feel naturally lived-in and grounded.

Overcoming Spatial Constraints

One of the most challenging aspects of this project was the tight urban site condition, where adjacent buildings restricted side openings and choked daylight. To counter this, we engineered cantilevered steel balconies along the façade, extending the spatial experience outward while drawing deep pockets of daylight and ventilation into the core of the home. Large windows paired with these extended balconies open up the master suite and living spaces to the outdoors, successfully balancing openness with privacy to create a bright, breathable atmosphere.
