INDIAN EXPERIMENTS IN ISS

Group Captain Shubhanshu Shukla travelled to the ISS with three other astronauts in the Ax-4 mission on June 25. He is assisting in these microgravity research experiments proposed by Indian scientists in R&D laboratories across the country

- Impact of microgravity radiation in ISS on edible microalgae

- Sprouting salad seeds in space—relevant for crew nutrition

- Impact of microgravity on food crop seeds

- Analysing human interaction with electronic displays in microgravity

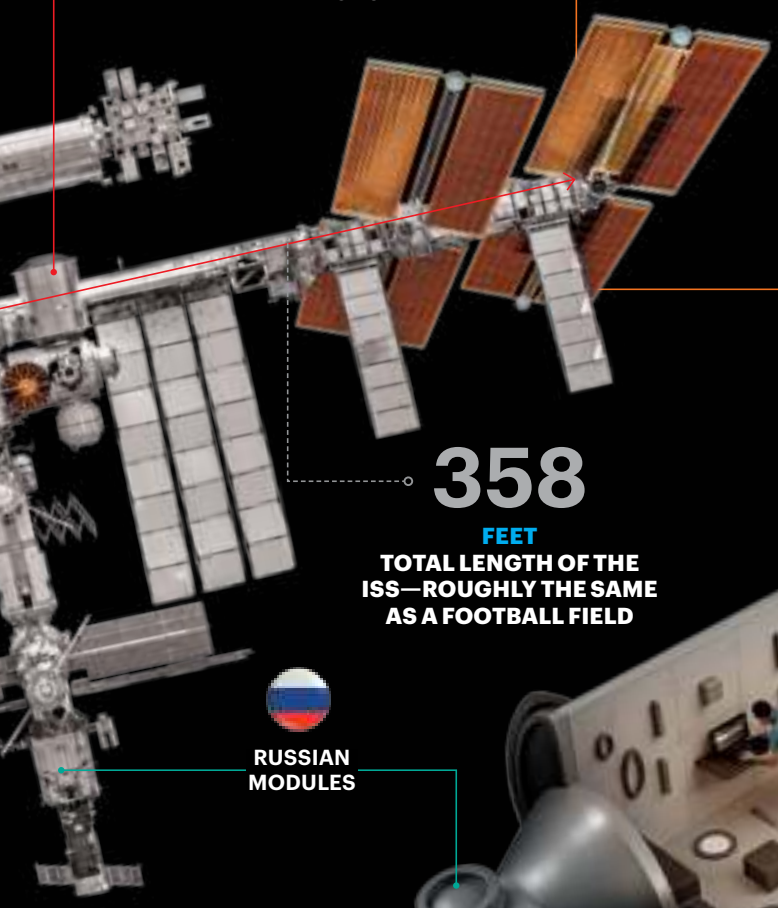

- Effect of metabolic supplements on muscle regeneration under microgravity

- Survival, reproduction, RNA transcripting of Eutardigrade Paramacrobiotus, a microscopic aquatic animal

- Growth, proteomics (specific cell proteins) responses of cyanobacteria on urea/ nitrate in microgravity

CANADIAN MODULE

358
FEET
TOTAL LENGTH OF THE ISS—ROUGHLY THE SAME AS A FOOTBALL FIELD

RUSSIAN MODULES

THE ZVEZDA MODULE

- Third module attached to the ISS when it docked to the Zarya module (both are Russian made) in 2000
- The 43-foot-long service module has station living quarters, distributes electrical power, and hosts data processing, flight control and propulsion system
- Provides communication system that includes remote command capabilities from ground flight controllers, docking port for Russian Soyuz and Progress spacecraft
