

POWERING VIKSIT BHARAT

HOW MNRE IS ACCELERATING INDIA'S CLEAN-ENERGY REVOLUTION

India is in the midst of an unprecedented clean-energy surge, with record additions in solar and wind power, rapid expansion of domestic manufacturing, and bold bets on green hydrogen and future fuels. At the centre of this transformation stand the Ministry of New and Renewable Energy (MNRE)- scripting a decisive shift towards Viksit Bharat, Net-Zero commitments and Aatmanirbhar Bharat in the energy domain.

MNRE: Driving India's Renewable Energy Take-off

Under the leadership of Hon'ble Prime Minister Shri Narendra Modi, MNRE has steered India from incremental progress to global leadership in renewables, positioning the country as the world's third-largest solar power generator with about 1,08,494 GWh of solar generation in 2023. India has already achieved 50% of its installed power capacity from non-fossil sources-five years ahead of its NDC target year of 2030- a milestone that few major economies can claim. Against the national target of 500 GW of non-fossil capacity by 2030, the country today has an installed-plus-pipeline non-fossil portfolio of nearly 507 GW, indicating that India is not just on track but ahead of schedule in its clean-energy transition. By 2024, India had become the world's third largest solar market in terms of installed capacity, overtaking traditional leaders like Japan and Germany.

This progress is most visible in solar power, where capacity has expanded at record pace. As of November 2025, solar capacity has jumped from about 94 GW to 132.85 GW in just one year, a remarkable 41% growth, while wind power has risen from 47.9 GW to 53.99 GW, up 12.6% year-on-year. Overall non-fossil installed capacity has climbed from roughly 213.7 GW to 262.74 GW, representing annual growth of about 23% and bringing India decisively closer to the 500 GW mark. These numbers underscore how MNRE has turned renewable energy from a niche sector into a core pillar of India's energy security and growth strategy.

Green Hydrogen, Storage and Emerging Technologies

MNRE's ambitions extend well beyond grid-connected solar and wind. Under the National Green Hydrogen Mission, approved with an outlay of ₹19,744 crore, India has set a target of producing 5 million metric tonnes (MMT) of green hydrogen annually by 2030. Global hydrogen roadmaps suggest around 140–150 GW of electrolysis capacity is targeted worldwide by 2030, and India's plans account for an estimated one third of this, underlining how central the National Green Hydrogen Mission is to the global hydrogen story. The Mission has already moved rapidly from policy to allocation: under Component I, about 3,000 MW of electrolyser manufacturing capacity has been awarded against a budget of ₹4,440 crore, while Component II has awarded projects totalling about 8,62,000 tonnes per annum of green hydrogen production backed by incentives of approximately ₹13,050 crore. These numbers signal a serious industrial strategy to build a full green-hydrogen value chain, from electrolysers and ammonia to fuel-cell applications.

Shri Pralhad Joshi
Hon'ble Cabinet Minister of New and Renewable Energy and Consumer Affairs, Food and Public Distribution
