Key Takeaways

- Gujarat became India's first state with a dedicated Semiconductor Policy
- ₹1.24 lakh crore attracted across four major semiconductor investments.
- More than 47,000 direct and indirect employment opportunities expected
- Dedicated Taiwan Desk operational for global investor facilitation
- SpaceTech Policy targets USD 5 billion investment and 25,000 jobs
- Strong talent pipeline anchored by PDEU and IIT Gandhinagar
- Dholera and Sanand emerging as globally benchmarked semiconductor clusters

At Pandit Deendayal Energy University, ATMP training centres are being developed to create more than 1,000 skilled professionals within five years. Designed with direct industry participation, the programme blends modern equipment, factory aligned curriculum and mentorship from professionals working inside operating fabs.

At IIT Gandhinagar, the SAMARTH initiative strengthens this workforce strategy through applied semiconductor manufacturing, advanced process research, training and indigenous IP creation. Together, these efforts signal a deliberate shift. Gujarat is not merely building factories. It is building the minds that will power the factories of the future.

Where Gujarat's Silicon Future Takes Shape

The Government of Gujarat has moved decisively beyond generic industrial parks to create purpose driven clusters for semiconductors and electronics. Dholera and Sanand have been designed to meet the exacting demands of advanced manufacturing.

Dholera Special Investment Region is emerging as Gujarat's flagship semiconductor destination, equipped with redundant water supply, reliable power infrastructure, hazardous material handling systems and dedicated logistics corridors linked to ports and airports. Its development is guided by international experts with experience in leading global semiconductor regions.

Shri Ashwini Vaishnaw and Shri Bhupendrabhai Patel at CG Semi inauguration ceremony at Sanand

Sanand GIDC, already a major automotive hub, is evolving into an advanced electronics and components ecosystem, strengthened by precision engineering talent, dense supplier networks and shared testing, calibration and prototyping facilities. Both clusters are supported under MeitY's EMC 2.0 scheme, ensuring central funding for common infrastructure and long term national commitment. Together, Dholera and Sanand stand as the twin engines of Gujarat's semiconductor and electronics growth.

Exchange of MoU between Digantara Research and Technologies Pvt Ltd and Government of Gujarat.

Beyond Manufacturing: The Multiplier Ecosystem

GSEM's innovation lies in its ability to see cross-sector relationships where others see silos. Pharmaceutical cleanroom expertise is being explored for space-grade manufacturing. Automotive precision engineering is being channelled into semiconductor equipment maintenance. Gujarat's renewable energy leadership is being positioned as a sustainability advantage for ESG-driven global manufacturers. This is industrial orchestration, not accidental growth.

A Mission with National Consequence

Gujarat's semiconductor and electronics initiative is today more than a state programme. It has emerged as a national prototype of how empowered policy, administrative capability and industrial trust can converge at scale.

Under the steady guidance of the Department of Science and Technology, Government of Gujarat, the state has demonstrated that deep technology can be built not just with financial capital, but with clarity of vision and institutional courage.

As global supply chains realign and technology becomes the defining currency of power, Gujarat's semiconductor awakening stands as a statement of quiet confidence. The silicon may be formed in clean rooms and fabs, but the ambition runs far deeper.

It signals a future where India designs, manufactures and delivers to the world. Where India builds what the world depends on.

Mr. Kai Beckmann, CEO, Merck with Secretary-DST and MD-GSEM during Semicon India 2025
