Transparent market design and tariff reduction

SECI has institutionalised a transparent, technology-driven competitive bidding framework that has become the standard for renewable energy procurement in India. **Its e-bidding processes**, supported by well-structured power purchase and sale agreements and robust payment security mechanisms, have substantially reduced perceived risks for developers and financiers, deepening investor participation from both domestic and international players.

As a result, renewable energy tariffs in India have declined dramatically over successive bidding rounds, making solar and wind power among the most cost-effective sources of electricity in the country. This affordability, coupled with **bankable contract structures**, has catalysed **rapid capacity addition,** expanded green power access, and strengthened India's position as a global frontrunner for competitive and transparent renewable markets.

Shri Akash Tripathi
Managing Director
Solar Energy Corporation of India Ltd.

Implementing national schemes and programmes

Under MNRE's overall supervision, SECI plays a pivotal role as Renewable Energy Implementing Agency for a series of flagship government schemes that span utility-scale and distributed segments. These include the **Solar Parks Scheme,** CPSU Scheme (Phase II, Tranche I and II), manufacturing-linked solar programmes, **PM Suryaghar** for government buildings, **PM-KUSUM** Component B, and newer initiatives focused on green hydrogen and green ammonia, among others.

For many of these schemes, SECI undertakes the **entire implementation chain:** managing the bid process, monitoring project progress, conducting site visits and commissioning verifications, and **facilitating release of central financial assistance** or subsidies on milestone basis wherever applicable. This comprehensive role ensures that policy intent translates into timely, high-quality assets on the ground and that public funds deployed for renewable development yield maximum impact.

Pathbreaking projects in CAPEX mode

In parallel with its intermediary role, SECI has directly executed several pioneering projects in CAPEX mode, particularly in regions and technologies that demand demonstration and leadership. Notable examples include the 100 MW solar PV project with a 40 MW/120 MWh Battery Energy Storage System at Rajnandgaon in **Chhattisgarh**, a **1.7 MW** solar PV plant with **1.4 MWh BESS** at Kavaratti in Lakshadweep, a 25 MW solar PV plant with **20 MW/50 MWh BESS** in the Union Territory of Ladakh, and a **100 MW floating solar project** in Jharkhand.

These projects validate advanced configurations such as large-scale storage integration, **floating solar technologies** and remote-area renewable systems under Indian conditions. By showcasing technical viability and operational benefits in **challenging terrains** and **island or high-altitude systems,** SECI's CAPEX projects pave the way for large-scale replication across the nation, serving as reference points for state utilities and private developers alike.

Financial performance and operational scale

SECI's operational strides are firmly anchored in strong financial performance and disciplined project management. In FY 2024-25, the corporation reported revenue from operations exceeding **₹15,000 crore** and a healthy standalone profit after tax, reflecting both the volume of renewable power handled and the robustness of its business model.

During the same period, SECI floated approximately **9.4 GW** of renewable energy tenders and awarded **about 8.4 GW** across solar, wind and hybrid/RTC/FDRE categories. It oversaw commissioning of several gigawatts of solar, wind and hybrid capacity, tendered more than **1 GW of energy storage**, and facilitated trading of over fifty thousand million units of renewable power, thereby directly contributing to India's climate commitments and energy security objectives.

Driving green hydrogen and Atmanirbhar manufacturing

SECI has also been entrusted with critical roles in the **National Green Hydrogen Mission** and associated initiatives around **Green Hydrogen and Green Ammonia**, which are vital for deep decarbonisation of hard-to-abate sectors. By facilitating early projects, **structuring demand and supply arrangements** and supporting **ecosystem development**, SECI is helping to lay the foundations of a future green-fuels economy.

Complementing this, SECI implements the **Production Linked Incentive (PLI) Scheme for high-efficiency solar PV modules**, which incentivises investment in domestic manufacturing. These efforts promote an **indigenous supply chain** for solar equipment, reduce import dependence, generate high-quality employment, and align directly with the vision of Atmanirbhar Bharat in the clean energy domain.

Transformational impact on India's energy landscape

Collectively, SECI's work has had a transformative impact on India's power sector, particularly in enabling a large share of renewables in the national generation mix. As a Renewable Energy Implementing Agency, the corporation now contributes to roughly **15 percent of India's renewable capacity** (excluding large hydro), firmly cementing its role as a key pillar of the country's energy transition.

By coupling **transparent market design** with **innovative products**, strong financials and effective **implementation of government schemes**, SECI has helped transform India from an energy-deficit nation towards one marching confidently toward energy surplus grounded in sustainability. Its initiatives extend the benefits of affordable, clean power to households, industries and institutions, while simultaneously attracting investment, nurturing domestic manufacturing and fostering cutting-edge technologies in storage and green hydrogen.

Inspired by this vision and supported by the proactive leadership of MNRE under Sh. Pralhad Joshi, SECI continues to push the frontiers of renewable energy deployment, innovation and institution-building.
