If quality is maintained consistently, acceptance follows. Reputation is built over time and sustained through discipline, especially in a business where there is little margin for error."

– Rajeev Mukul

facilities dedicated to plastics and packaging. According to Rajeev, growth has often come from anticipating demand rather than reacting to it. "If quality is maintained consistently, acceptance follows. Reputation is built over time and sustained through discipline, especially in a business where there is little margin for error," he says.

Those familiar with the organisation describe Rajeev Mukul as closely involved in operations, particularly on the factory floor. Systems, checks, and compliance form the backbone of decision making, an approach that has helped the company adapt as regulatory oversight has intensified. For Zee Laboratories, stricter regulation has strengthened internal processes rather than constrained them.

"The industry has changed," Rajeev notes. "There is far greater scrutiny today on both affordability and quality. Regulators are more engaged, and that ultimately serves patients."

As the domestic market stabilised, the company began looking outward. "Much of India is already covered," Rajeev says. "The focus now is on reaching regions where access to medicines is still limited."

That effort is led by Rohan Mukul, who oversees exports and overseas markets. His role centres on ensuring that medicines manufactured in India meet regulatory expectations across geographies. "Export markets demand consistency. Products manufactured in India must meet identical standards across every market they serve," Rohan explains.

Zee Laboratories reported revenues of approximately ₹600 crore in the financial year ending March, with plans to reach ₹1,000 crore in the coming years. Its portfolio spans pharmaceuticals, dermatology, cosmetics, and hospital supplies, with a significant presence in public healthcare procurement.

Manufacturing capability has expanded alongside scale. One recent addition is a Large Volume Parenterals facility in Karnal. "It was the first LVP plant in Haryana and among only three in North India," Rajeev says. The investment was driven by the need for essential hospital products rather than visibility.

The company is also preparing to establish a vaccine manufacturing facility in Karnal. Leadership describes the project as one that demands long planning cycles and regulatory certainty, elements they view as essential when building for longevity rather than short term gains.

Research and development is expected to assume a larger role in the years ahead. Rohan believes Indian pharmaceutical companies must move beyond manufacturing alone. "India is known for affordable medicines," he says. "The next phase is about developing new products. With policy support for research, companies can invest with greater confidence."

Environmental responsibility is integrated into daily operations at Zee Laboratories. All manufacturing units operate waste treatment systems to ensure that no untreated discharge leaves the premises. "Every waste stream passes through a complete process before it exits the plant," Rajeev says.

The company has also reduced paper usage through digital systems and reorganised logistics to limit unnecessary movement. Shared transport for factory workers has replaced multiple individual vehicles. "One vehicle carrying many workers directly reduces emissions," Rohan notes.

Export markets demand consistency. Products manufactured in India must meet identical standards across every market they serve."

When the conversation turns to corporate responsibility, the company points back to its core work. Zee Laboratories supplies medicines to government hospitals and institutions such as AIIMS, as well as to central and state health programmes where medicines are distributed free of cost under public schemes.

"Providing quality medicines at affordable prices is our contribution," Rajeev says. "That impact reaches people every day."

More than three decades after its founding, Zee Laboratories continues to operate with the same clarity that shaped its early years. The company has expanded its manufacturing footprint and market reach, but its approach remains unchanged. Decisions are taken with a long term view, systems are followed closely, and responsibility to patients remains central. In a pharmaceutical business where consistency matters as much as scale, that steadiness defines Zee Laboratories today.

ZEE LABORATORIES AT A GLANCE

- Eight manufacturing units across pharmaceuticals, plastics, and packaging.
- Set up Haryana's first Large Volume Parenterals manufacturing facility.
- A portfolio spanning formulations, injectables, dermatology, cosmetics, and hospital supplies.
- A regular supplier to government hospitals, AIIMS, and national and state health programmes.
- Approximate revenues of 600 crore in the most recent financial year.
- Plans for a vaccine manufacturing facility with long term capacity in mind
