

The All-New Hector builds on everything that made the original successful, while adding layers of sophistication and intelligence. The SUV now features an even more intuitive user interface, enhanced connected car technologies, advanced safety systems, improved interiors with premium materials, and a refreshed design that balances boldness with elegance. From its expansive digital cockpit and intelligent voice commands to advanced driver assistance features and enhanced comfort for long drives, the new Hector feels tailor-made for today's discerning consumer—someone who values both innovation and reliability.

Yet, what truly distinguishes the All-New Hector is that it doesn't chase novelty for novelty's sake. Every upgrade feels purposeful, aimed at making mobility safer, smarter and more enjoyable. It is evolution with intent—something that has become a hallmark of the MG philosophy.

The Real Power Behind the Badge

While the technology, design and performance of the MG Hector often take centre stage, there is another story unfolding quietly behind the scenes—one that deserves equal attention. At JSW MG Motor India, women are not just participants in the journey; they are at the very core of it.

In an industry traditionally perceived as male-dominated, MG has redefined the rules. Women play a critical role across the organisation, from shop-floor operations to leadership positions, contributing to decision-making, quality control, innovation and customer experience. Today, over 40 per cent of MG's workforce comprises women—a remarkable achievement in the automotive manufacturing space.

What makes this even more compelling is the depth of their involvement. In certain areas, such as the Battery Shop Floor, women constitute as much as 80 per cent of the workforce. These are not symbolic roles; they are highly technical, precision-driven responsibilities that demand skill, focus and expertise. MG's approach demonstrates that inclusivity is not a corporate slogan but a strategic strength.

Perhaps the most powerful testament to this philosophy was the rollout of the 50,000th MG Hector—a vehicle manufactured entirely by women. It was more than a milestone; it was a statement. A statement that the future of mobility is not just electric, connected or autonomous—it is also inclusive.
