

Union Finance Minister Nirmala Sitharaman presents her ninth consecutive Union Budget in New Delhi on February 1.

HOW INDIA'S INFRASTRUCTURE THRUST AIMS TO EXTEND THE ADANI GROUP'S RUNWAY

With a record ₹12.2-lakh-crore infrastructure push, targeted levers for aviation, data centres and energy and new incentives for municipal finance, the Modi government has reinforced a growth template that closely aligns with the Adani Group's presence across ports, airports, power, renewables, logistics and digital infrastructure. The big numbers reveal how the Group's expansion is increasingly interwoven with India's broader economic rise.

The Adani Group-operated Dhamra Port in Odisha was cited in the Union Budget as an example of port-led regional growth.

When a government signals scale with clarity and consistency, businesses that already operate at scale see not just opportunity, but alignment. India's current policy direction does precisely that. By placing infrastructure, energy security, digital capacity and urban finance at the centre of its growth agenda, the government is laying the foundation for a long investment cycle in which public intent and private execution move in tandem.

At the heart of this approach is a record ₹12.2-lakh-crore allocation for infrastructure. This is not an incremental spending. It represents a decisive shift towards capital expenditure as the primary engine of economic momentum. Roads, ports, airports, power systems and digital networks are increasingly viewed as interconnected systems rather than standalone assets, reducing friction across the economy and lifting productivity at scale.

Infrastructure as a Multiplier

For large infrastructure companies such as the Adani Group, this systems-led approach creates a multiplier effect. Ports gain value when road and rail connectivity improve. Airports scale faster when regional aviation expands. Power and renewable assets perform best when generation, transmission and distribution grow together. Digital infrastructure thrives when
