The model marks a significant philosophical shift—from the earlier paradigm of "population control" to a more holistic approach centred on **"population care."**

At the core of the strategy is a five pillar framework designed to address demographic change in a comprehensive manner.

The first pillar focuses on **maternal and reproductive health**, aiming to strengthen reproductive care and ensure that families have access to modern healthcare services, counselling and informed family planning options. This is particularly important in a state where family planning has historically relied heavily on sterilisation, which currently accounts for a large share of contraceptive methods used by married women.

The second pillar emphasises **digital public health infrastructure**, including the rollout of integrated platforms that can track health services, provide predictive alerts and improve continuity of care across the population.

The third pillar focuses on **women's empowerment and workforce participation**, recognising that gender equality plays a critical role in demographic stability. Andhra Pradesh aims to increase female labour force participation significantly through measures such as workplace childcare, safer mobility and shared parenting policies. Increasing women's workforce participation could potentially boost the state's Gross State Domestic Product by as much as **15 percent**, according to internal projections.

The fourth pillar addresses the needs of an ageing population. As the number of senior citizens rises, the state is working to expand geriatric healthcare infrastructure, develop professional caregiving services and create opportunities for senior citizens to remain economically and socially active.

Finally, the fifth pillar focuses on **skills and productivity**, ensuring that the state's workforce remains competitive in a global economy even as its size stabilises. By investing in digital literacy, healthcare services and specialised skills aligned with emerging industries, Andhra Pradesh hopes to maximise the economic potential of every worker.

Taken together, these initiatives represent a forward looking approach to demographic governance. The objective is clear: to ensure that Andhra Pradesh's current demographic window—where nearly **63 percent of the population is under 35 years of age**—translates into sustained economic growth before ageing pressures intensify.

For policymakers, the stakes are high. If managed well, demographic transition can become a powerful engine for development. If neglected, it could strain public finances, weaken labour markets and slow economic progress.

Andhra Pradesh's emerging strategy suggests that the state is determined to stay ahead of the curve. By integrating health, gender equity, social protection and skilling into a unified demographic framework, the government aims to transform population management into a cornerstone of its long term development vision.

In doing so, Andhra Pradesh hopes to demonstrate that demographic change need not be a constraint. With the right policies, it can become a catalyst for building a healthier, more productive and more prosperous society.

The objective is clear: to ensure that Andhra Pradesh's current demographic window–where nearly 63 percent of the population is under 35 years of age–translates into sustained economic growth before ageing pressures intensify.
