playbook yourself and edit it frequently. Second, you need to stay closely connected with teams building everything in San Francisco and people using it in India. It is a two-way signal: translating the product for users, gathering feedback on how India uses it and taking that feedback back to the teams. You also need curiosity and a learner's mindset. In the last two weeks, we launched three models. In a large organisation, you might wait for enablement and support to be ready. Here, you need to keep learning.

Finally, you must be a builder and be scrappy. You need an end goal, a compass and navigation, while remaining ready to change routes and stay flexible. These are the changes I have adapted to at Anthropic, and I am thriving here.

AI is moving very fast, and there has been discussion about slowing down. What is your view, and how are you keeping pace with the development?

Dario's essay, *Pacing the Frontier*, outlines the ethos of ensuring that whatever we build is safe, reliable and trustworthy. The entire ecosystem of model providers, not just one organisation, must embed these principles in its work.

Countries and democracies must also work alongside organisations and think carefully about what they put into people's hands. Anthropic has built mechanisms to regulate and monitor what we do and keep everyone honest as we build together.

Anthropic is focused on enterprises, which value trust above all else because their brands depend on it. Protecting trust, reliability and security must take priority. These principles must be reflected in what we put into customers' hands, and we must build together with them.

India is Claude's second-largest market. What have you achieved in India over the last nine to ten months, particularly in enterprise adoption?

India was chosen because it deeply aligns with Anthropic's mission. As a public-benefit company focused on global good, Anthropic aligns with India's ambition to drive nuanced use cases for the last mile.

I want to focus on three areas: the enterprise journey, ecosystem creation, and working with the government in priority sectors.

For enterprises across financial services, government and healthcare, key concerns include where data resides, how it is processed and
