

whether it leaves the country during inferencing. We worked closely with our San Francisco teams and AWS on engineering required to bring inferencing to India. We announced this in August and went live in September. This will unlock opportunities in regulated segments, including banking, manufacturing, telecom and government.

Second, we are building the ecosystem by bringing in applied AI team members, customer success managers and people focused on policy and beneficial deployment. They will work with partners, venture capitalists and funds to scale our efforts.

Third, we are working with the government on beneficial deployments across education, life sciences and healthcare.

We believe replicable solutions developed in India for population-scale problems can serve the country and become templates for the Global South.

With major investments from Google and other companies, do you think the road ahead will be challenging?

We need to look at AI's evolution across three areas: ensuring relevance to the country, solving complex frontier use cases, and building partner ecosystems that serve Indian customers while creating templates for global markets. For relevance and last-mile usage, we are working with Karya and others to make Claude available in more than 10 languages.

For enterprises, Claude excels at genuinely complex use cases. With inferencing available in India, we are working with banks and manufacturers on modernisation and agentic applications that improve efficiency and support people working alongside AI.

The third area is partnerships. India has a large global systems integrator (GSI), advisory and solution-partner ecosystem.

How will Anthropic's partnerships with TCS, Infosys, HCL and other Indian IT services companies influence AI adoption?

We partner with major global systems integrators in India, including TCS, Infosys, HCL, Cognizant, UST, LTM and LTTS. These partnerships have three elements.

First, partners adopt the technology themselves as customer zero and build skills through certifications. Customers want assurance that their providers are adopting cutting-edge technology and understand how to use it.

Second, our applied AI team works with partners to infuse Claude into existing solutions or build AI-native ones. Partners are upskilling employees, supported by our ecosystem and direct training.

Third, we work together on go-to-market initiatives.
