Infosys has infused Claude into its Topaz solution. TCS has developed a solution through which it is taking TCS iON to regulated segments. Cognizant has skilled more than 30,000 employees to serve regulated sectors such as healthcare and insurance. Our priorities are adoption as a customer, building replicable solutions for joint go-to-market efforts, and ensuring production readiness and skilling. Our larger ambition is to take solutions created with GSIs in India to global markets.

How much of Anthropic's India strategy focuses on enterprise sales versus enabling developers to build products on Claude?

These are two sides of the same coin. Enterprises run software, while developers build it. Developers work across start-ups, digital natives, GSIs, IT services and industries.

Swiggy and Instamart, for example, created a solution that serves queries across 40,000 products. NPCI created AI Next, built as an MCP that can connect with other merchants. Razorpay created Merchant Studio, an agent through which users can connect not just to agents but also reclaim cards and undertake forecasting.

Enterprises are also running and developing these products. Manufacturers such as Reliance, Mahindra and Godrej are improving internal productivity and efficiency while building products for customers.

Banks, including Kotak, IndusInd Bank and Axis Bank, are creating intelligence layers and AI-led platforms. With inferencing available in India, governance and other parameters are built into the environment, enabling innovation for internal and customer-facing applications.

How does it feel to lead a global company in India as a woman, and what strengths do women leaders bring to the AI frontier?

It is a moment of immense pride, and I feel grateful and honoured by the opportunity.

India has experienced four waves: the internet, mobile, cloud and AI. That experience matters when serving enterprises that need solutions that are safe, reliable, simple and integrated. The learning and credibility built over many years are important, and I believe this creates opportunities for women leaders who have lived through these eras.

Women leaders at the frontier bring several strengths. First is their range: solving mission-critical enterprise problems, working with governments on population-scale challenges, and collaborating with public-benefit organisations and NGOs addressing nuanced needs at the grassroots.

Second, women are good at bringing diverse teams together, adding different textures, colours and richness to how AI is formed. Third, they can connect the dots, close the loop and see the bigger picture.

In everyday life, women wear multiple hats. One day, you might be the captain of a ship, steering it through complexity and staying on course. Another day, you might sculpt things, create opportunities and make things happen. A third day, you might roll up your sleeves and do the grunt work because it needs to be done.

Women often do all three on the same day. I believe steering the ship, sculpting things and being a doer are ways women can help bring things to the frontier. BT
