DR. DEEPIKA KRISHNA

Pioneering a New Era of Longevity and Preventive Healthcare

Dr. Deepika Krishna
Founder
Immunosciences and Longevity & Beyond Clinics (L&B Clinics)

For generations, healthcare has followed a reactive model: identify the disease, treat the symptoms, manage the consequences. But as chronic conditions strain health systems and longer life expectancy reshapes what wellbeing means, a new question is emerging: what if healthcare could help people understand their risks earlier and preserve their vitality for longer?

This question is at the heart of Dr. Deepika Krishna's work. As Founder of Immunosciences and Longevity & Beyond Clinics (L&B Clinics), she is building a model that moves beyond episodic treatment towards proactive, data-informed and personalised care. Her focus is on extending not just lifespan, but healthspan: the years lived with strength, independence and vitality. A healthcare entrepreneur, TEDx speaker and executive leadership alumna of The Wharton School, she represents a new generation of leaders who view medicine through the lens of prevention, innovation and measurable outcomes.

Building Trust Through Science

In a wellness market crowded with ambitious promises, scientific credibility is a defining differentiator. Immunosciences emphasises research-informed formulations, rigour and transparency. The philosophy is simple: health solutions should be grounded in evidence, designed with purpose and communicated responsibly. As consumers increasingly want to know what they put into their bodies and why, science becomes not just a differentiator but the foundation of trust.

A New Architecture for Personalised Healthcare

If Immunosciences translates science into preventive wellness, L&B Clinics bring that vision into a personalised clinical setting. The clinics integrate advanced diagnostics, including genomics and microbiome analysis, with individual health assessment to build a fuller picture of each person's biological profile.

The premise is that people differ in their biology, risks and responses to lifestyle choices, and a uniform approach cannot always account for this. These tools are not standalone predictors or substitutes for established medical care. Their value lies in how they are interpreted alongside clinical history, conventional investigations and professional judgement.

Making Healthspan the Ambition

Living longer does not automatically mean living well. The real challenge is preserving physical capability, cognitive function, metabolic health and quality of life with age. This requires a shift from periodic check-ups and generic advice towards meaningful risk assessment, personalised guidance and sustained engagement, with diagnostics leading to appropriate action and recommendations rooted in evidence rather than quick fixes.

Leadership with a Long-Term Vision

Longevity is fast becoming a frontier for healthcare innovation, but building in this space takes more than sophisticated testing. It demands scientific credibility, responsible clinical practice, patient education and a long-term perspective that values trust over trends. For India, where healthcare needs are evolving, models that pair innovation with scientific accountability could help build a more proactive culture of health.

Dr. Deepika Krishna's vision places responsibility at the heart of innovation. The goal is not to promise immortality, but to help people make better decisions about their health. As she sees it, the question must change from "How do we treat the disease?" to "How do we help people stay healthier for longer?"

The ambition is clear: a future in which longevity is not just about adding years to life, but about making those years healthier, stronger and more fulfilling.
