move towards greater specialisation and personalisation. Today, students spend two years in a programme and receive a broad set of experiences. Some of that knowledge becomes relevant immediately, while some becomes useful much later in their careers.

In the future, people may want to acquire specific expertise at the time they need it. Leadership education may become more valuable when someone is leading complex teams and organisations.

The curriculum will become sharper. People will choose what they need rather than receive a fixed package of courses.

Q: Does the future of the MBA lie in a more continuous and flexible learning model rather than a one-time degree experience?

A: I think that is possible. The current model provides a complete package—a buffet of courses that students consume together. The future may look more like an à la carte model where people choose courses at different points in their careers.

Someone may take one course today, return after a few years for another, and continue building knowledge over time. It will require business schools to organise themselves differently because demand will become less predictable.

This is a hypothesis, not a certainty. But institutions need to prepare for this possibility.

Q: As careers become more dynamic, will lifelong learning and executive education become increasingly important alongside the traditional MBA?

A: I think so. It will keep business schools accountable because they will constantly have to ask whether what they are offering remains relevant.

The market will increasingly determine what works. Companies may come to institutions and say that certain courses are valuable while others are no longer needed. This will create greater innovation in classrooms, curriculum and teaching methods.

Q: If management education moves towards greater personalisation, what could be the implications for cost and affordability?

A: The customer may increasingly become the organisation rather than the individual student. Companies may decide what skills they need and invest in developing employees through customised programmes. Such education may become more expensive because personalisation removes uniformity. But companies will evaluate whether the investment generates returns.

At the same time, technology is improving faculty productivity. Tasks such as creating teaching material, designing exercises and developing curriculum can now be done much faster. This means faculty members can potentially do more without a corresponding increase in numbers.

Q: As artificial intelligence (AI) reshapes learning and work, how is it changing the way business schools approach education?

A: We are still learning how to deal with AI. One concern is that students may receive answers and summaries instantly without going through the process of struggling with problems themselves. That struggle is an important part of learning.

At the same time, people with deep expertise can become much more effective with AI. The challenge for educational institutions is to understand where AI should not be used, where it should be used alongside learning and where certain tasks no longer need to be taught in the same way.

"The future may look more like an à la carte model where people choose courses at different points in their careers"

It will take time to develop a mature understanding of how AI should be integrated. But I am optimistic that society will adapt.

Q: Looking ahead, what qualities will define a successful manager in a rapidly changing business environment?

A: A successful manager will be the person who is most curious and most open to learning. The pace of change means that what was correct yesterday may not be correct today. One of the most dangerous phrases in business is: "We do this because this is the way we have always done it."

Future leaders will need curiosity, judgement, critical thinking and the ability to build relationships. Those qualities will remain central even as the business environment changes.
