TABLE 3.1

Conceptualizing International Financial Statecraft

Dimension	Traditional Conceptualization	Expanded Conceptualizations
Agent	Individual state	Group of states acting jointly
Target	Individual state	Group of states Social system within which states interact (e.g. multilateral institution, global regulatory regime, or global market)
Means	Offense (via coercion)	Positive inducement or persuasion Defense (via protection or substitution)
Understanding of "interstate power"	Influence	Autonomy; structural power
Agent redux	Major power	Rising or intermediate power(s)

Each dimension of the traditional conceptualization of financial statecraft may usefully be expanded. The agent may be either an individual state, or a group of states. The target may be an individual state, a group of states, or a social system within which states interact, as within a multilateral institution such as the International Monetary Fund (IMF), a global regulatory regime such the various Basel bank regulatory committees plus their wide transnational networks, or simply global markets themselves. The means for achieving state goals via financial and monetary statecraft are not necessarily offensive and coercive. They also may be actively directed outward toward others while employing inducement or persuasion.[4] For example, inducements may include subsidized sovereign lending, as well as the offer of membership in prestigious financial regulatory clubs, such as the Financial Stability Board (FSB) or Basel committees. Persuasive financial statecraft
