weaponised, chaining multiple weaknesses into a single crippling attack and potentially destabilising systems at machine speed. Mythos, Anthropic says, has identified vulnerabilities across major operating systems and browsers, including one that had reportedly gone undetected for 27 years. Reports of a possible breach of Claude Mythos Preview by a private forum only deepened the anxiety.

> **The cyber challenge of Mythos is a big one. MeitY is seized of it and is engaging with the US administration, Anthropic and vendors, who have been given a chance to test Mythos, to see what steps we should take**

Anthropic's answer to the risks posed by its own creation was Project Glasswing, a restricted-access cybersecurity initiative that underscored the gravity of the threat. Instead of releasing Mythos openly, Anthropic placed it in the hands of a select consortium of software giants and critical institutions to use it defensively—to find zero-day vulnerabilities, stress-test systems and patch weaknesses before adversaries could exploit them. If Mythos symbolised the danger of autonomous cyber AI, Glasswing was the first attempt to keep the genie in the bottle.

The Worldwide Worry

For the rest, we have a technology story turned into a systemic risk one. Across capitals, concern spread that Mythos represents the beginning of a new category of digital threat: not AI that merely generates content or writes code, but AI capable of autonomous cyber operations. The World Economic Forum's Global Cybersecurity Outlook 2026 captured that anxiety when it warned that while generative AI had so far mainly amplified social engineering and reconnaissance, the emergence of autonomous AI agents capable of executing attacks could mark a turning point. The warning moved rapidly into policymaking. On April 7, US Treasury Secretary Scott Bessent and Federal Reserve Chair Jerome Powell reportedly convened an urgent closed-door meeting with chief executives of major American banks to discuss the cybersecurity risks posed by Mythos. Across Europe and Asia, central bankers, regulators and security agencies began examining whether cyber vulnerabilities could evolve into systemic financial risks.

India responded with unusual urgency. On April 23,
