

Volvo

Volvo is set to expand its electric fleet with the launch of the flagship EX90. Unveiled a few years ago, the EX90 serves as the electric counterpart to the XC90 SUV, and largely looks the same. Updated last year, the EX90 features a new 800-volt architecture, allowing it to charge even faster, while an upgraded NVIDIA chip ensures enhanced driver assistance and collision avoidance. The shift to 800V architecture also means that the EX90 has better acceleration and improved efficiency. The EX90 features seating for seven passengers, and a clean interior layout made from sustainably sourced materials. The software on the infotainment is Google-based, allowing direct Maps, and other Google app usage without the need to pair a smartphone.
