LIVING LONGER BUT UNHEALTHIER

The World Health Organization's latest global health estimates show two parallel shifts in India. People are living longer but chronic diseases now account for a much larger share of mortality

THE LIFE EXPECTANCY

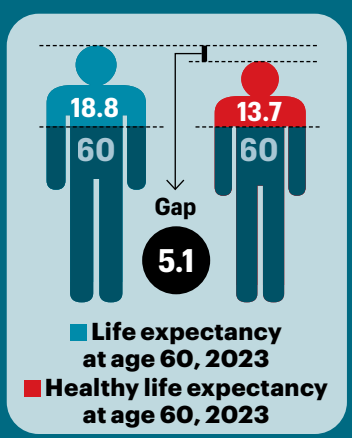

Indians are now expected to live more than eight years longer than they were at the turn of the century

SURVIVAL BEYOND 60

Indians who reach 60 can expect to live another 18.8 years, but 5.1 of those years may be spent in poorer health

(Figures in years)

SOURCE: *WHO's 'Global Health Estimates 2023', released on Oct. 2, covering mortality, life expectancy and disease burden from 2000–2023. WHO cautions that India's cause-of-death figures are modelled statistical estimates because usable death-registration data are limited*

COVID REBOUND

Life expectancy has recovered after Covid-19, but healthy life expectancy has barely improved
