GLOBAL LAG

India trails the global average by more than two years in both life expectancy and healthy life expectancy

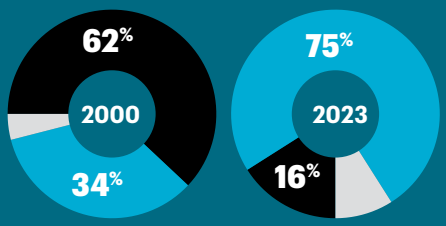

27% of an average Indian's remaining years after 60 may be spent coping with health problems; across a lifetime, the share is expected to be 15%

DISEASE SHIFT

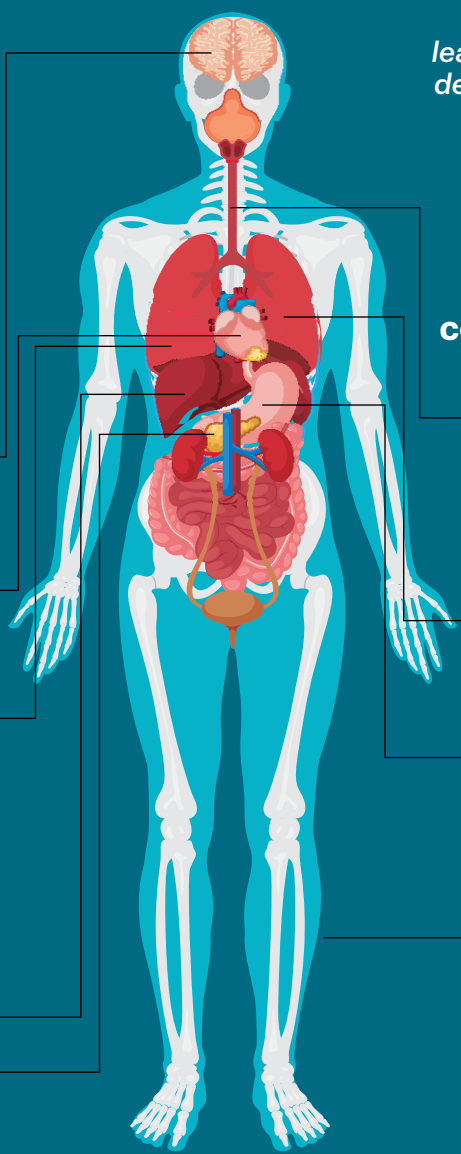

India's mortality profile has flipped from infectious diseases to chronic, non-communicable ones over the past two decades

TOP TEN KILLERS

Deaths (per 100,000 persons), 2023

India's four leading causes of death are all non-communicable diseases

NON-COMMUNICABLE DISEASES

Stroke
74.8

Ischaemic heart disease
138.5

Chronic obstructive pulmonary disease (COPD)
83.2

Cirrhosis of the liver
21.8

Diabetes mellitus
49

COMMUNICABLE DISEASES

Lower respiratory infections
25.8

Tuberculosis
26.2

Diarrhoeal diseases
28.1

INJURIES

Road injury
25.4

Falls
17.9

- **Heart disease is the leading cause** of death in India. Alongside stroke, the third-leading cause, it underscores the heavy burden of cardiovascular disease
- **COPD is the second-leading cause,** highlighting the growing toll of risk factors such as air pollution and smoking
- **With diabetes accounting for the fourth highest** number of deaths, it reflects the mounting threat of metabolic and lifestyle-related diseases
- **Tuberculosis and diarrhoeal diseases were the leading killers in 2000**, with death rates of 92.4 and 87.8, respectively. Though their rates have declined, infectious diseases still rank among the top seven causes of death
