manufacturing centre. LG Electronics is investing approximately ₹5,001 crore in a new facility, while four supplier companies are expected to invest another ₹839 crore, creating a local component ecosystem around the plant.

The challenge is execution. Semiconductor manufacturing requires enormous capital, specialised talent, reliable power and water, advanced clean-room infrastructure and deep supplier networks. Announcements now need to translate into operating facilities and supply-chain ecosystems.

AMARAVATI'S QUANTUM BET

While semiconductors represent today's hardware economy, quantum computing is a wager on the next decade.

The state has chosen Amaravati as the hub of this effort. The Amaravati Quantum Valley is being developed on a 50-acre Phase I site comprising the Amaravati Quantum Computing Centre, Quantum Valley Tech Park and associated R&D infrastructure. Open-access testbeds at Gannavaram and SRM University are intended to support early-stage research and experimentation.

The initiative aligns with the Government of India's National Quantum Mission, which has an approved outlay of ₹6,003.65 crore through 2030-31.

The state's vision is ambitious: attract close to $1 billion in cumulative investment by January 2029 while creating a complete ecosystem spanning hardware, software, research, manufacturing and skills development.

Partnerships provide an international dimension. IBM, TCS and the Andhra Pradesh government have collaborated on the Quantum Valley Tech Park. IBM-TCS Quantum Cloud Services and the IBM-TCS Quantum Innovation Centre have already been launched, while Microsoft's proposed quantum-computing installation would add another layer to the planned ecosystem.

Infrastructure, however, is only part of the equation. More than 10,000 students have been enrolled in quantum-skilling programmes against a target of 50,000. The next challenge is developing researchers, engineers, hardware specialists and entrepreneurs capable of sustaining a long-term quantum ecosystem.

ANDHRA PRADESH: POWERING THE GREEN FUTURE

From renewable power and energy storage to green hydrogen and ammonia, Andhra Pradesh is building the foundations of a new clean-energy economy that could connect its coastline, industrial centres and resource-rich hinterland to global markets.

The next industrial story of Andhra Pradesh may be built not around steel, cement or automobiles, but around electrons and molecules.

Across the state, a new clean-energy architecture is taking shape. The coastal belt stretching from Visakhapatnam and Pudimadaka to Kakinada is emerging as a potential hub for green hydrogen and green ammonia. In Rayalaseema, Kurnool, Nandyal and Anantapur are becoming important centres for renewable generation and energy storage. Further south, the Nellore-Tirupati-Sri City corridor is beginning to attract manufacturing linked to the clean-energy value chain.

The state's proposition is ambitious but clear: combine solar and wind resources with storage, ports, industrial demand and manufacturing to create an integrated clean-energy ecosystem rather than a collection of standalone renewable-power projects.

The next industrial story of Andhra Pradesh may be built not around steel, cement or automobiles, but around electrons and molecules.

As of June 30, 2026, Andhra Pradesh had 16,600.87 MW of installed renewable-energy capacity. Against this base, developers have announced or committed a green-energy investment pipeline estimated at ₹1.4-1.5 lakh crore. The Integrated Clean Energy Policy 2024 sets a longer-term ambition of more than 160 GW of clean-energy capacity, including 78.5 GW of solar, 35 GW of wind, 22 GW of pumped storage, 25 Gwh of battery storage and 1.5 million tonnes per annum of green hydrogen.

The targets are significant, but so is the challenge. Much of the pipeline remains at different stages of development, making execution and commissioning the real measure of progress.

THE COASTAL GREEN-MOLECULE CORRIDOR

The strongest element of Andhra Pradesh's clean-energy proposition is geography.

Visakhapatnam, Pudimadaka and Kakinada together form a coastal corridor where renewable power can be converted into green
