Uttar Pradesh Emerges as the New Powerhouse of Green Energy

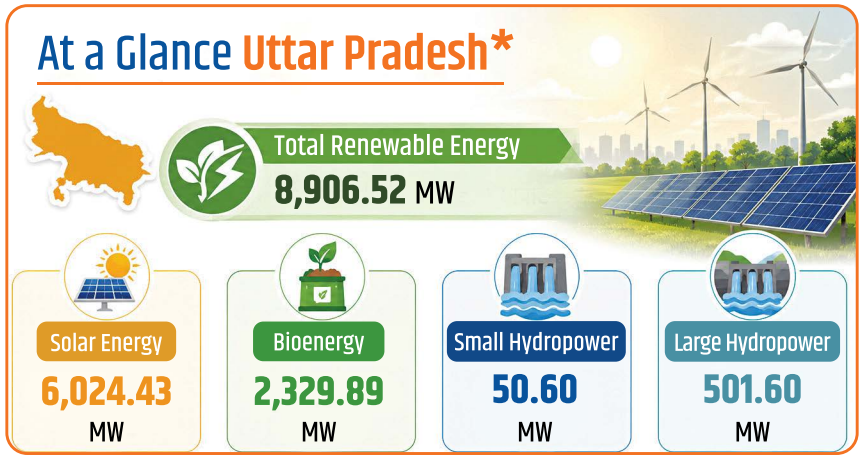

For decades, Uttar Pradesh grappled with challenges such as power shortages, high energy costs and rising demand for electricity. However, the transformation in the state's energy policy over the past nine years extends far beyond increasing power generation. Under the leadership of Chief Minister Yogi Adityanath, the Government is steering Uttar Pradesh towards a green energy-based economy. Simultaneous efforts across sectors such as solar energy, green hydrogen, electric vehicles, renewable energy investments and energy efficiency are shaping a new energy landscape for the state.

One of the most significant examples of Uttar Pradesh's energy transformation is the PM Surya Ghar: Muft Bijli Yojana, under which the domestic rooftop solar programme has witnessed unprecedented growth. In June 2026, Uttar Pradesh secured the top position in the country by installing 71,888 residential rooftop solar systems. This was not only the state's best-ever monthly performance but also a national record for the highest number of residential rooftop solar installations by any state in a single month. This achievement reflects how solar energy in Uttar Pradesh is no longer just a government initiative but is rapidly evolving into a people's movement. So far, the state has received more than 11.50 lakh applications, while over 7.5 lakh residential rooftop solar systems have already been installed. Uttar Pradesh has consistently remained the country's leading state in terms of monthly installations for several months. As a result, Uttar Pradesh has surpassed Maharashtra to become India's second-largest state in total rooftop solar installations.The Government's next target is to surpass Gujarat and secure the top position nationally.

Uttar Pradesh Enters the Two-Gigawatt Club

Uttar Pradesh has also crossed the historic milestone of 2 GW of installed residential rooftop solar capacity. With this achievement, the state has joined an exclusive group of states that previously included only Gujarat and Maharashtra. This milestone is not merely a statistical accomplishment but also a reflection of the state's changing priorities in the energy sector. The state has now installed more than 2,500 MW of rooftop solar capacity. Additionally, subsidies worth over ₹5,500 crore have been transferred directly into consumers' bank accounts, making solar energy significantly more affordable and financially attractive. More than 7,000 companies and vendors are currently active in the sector, generating over 80,000 direct and indirect employment opportunities. Rooftop solar installations are now producing nearly 96 lakh units of electricity every day, with an estimated value of more than ₹6 crore per day. This has not only reduced electricity bills for consumers but has also strengthened energy self-reliance across the state. Compared to large-scale solar parks, the rooftop solar programme has also helped save more than 9,000 acres of land, making it a significant achievement from the perspective of optimal land utilisation. The success of the programme has been driven by close coordination among UPNEDA, power distribution companies (DISCOMs), banking institutions, empanelled vendors and lakhs of consumers. As a result, solar energy in Uttar Pradesh is steadily evolving beyond a government programme into a model of participatory development driven by public involvement.

Focus on Green Hydrogen

Alongside solar energy, Uttar Pradesh is now stepping up investments in next-generation energy technologies. As part of this strategy, the State Government has decided to establish two Centres of Excellence dedicated to the green hydrogen sector. The first centre will be set up in
