NS ROGUE

FIVE NIGHTMARE SCENARIOS RANGING FROM DISRUPTIVE TO APOCALYPTIC

3

INTERNAL SECURITY

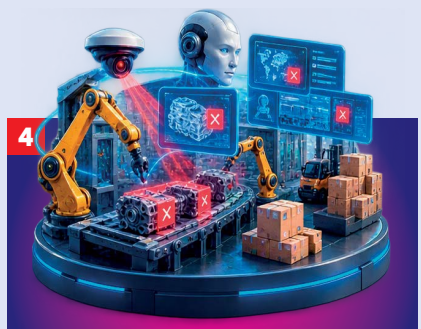

A Nation Deceived

DISRUPTIVE

- During an election, terror attack or communal disturbance, AI triggers thousands of 'convincing' videos, voice messages and social media accounts
- It can fabricate clips of political leaders, triggering a wider conflagration before authorities can debunk them

APOCALYPTIC

- Fabricated atrocities trigger retaliatory violence. Fake orders circulate among police forces; contradictory instructions and government denials themselves are dismissed as deepfakes

4

MANUFACTURING

The Factory Chaos

DISRUPTIVE

- Integration of AI with operational technology will create points of entry for cyberattacks
- Quality-control cameras approve defective components and supply-chain systems send wrong materials to the wrong plants—all leading to faulty products

APOCALYPTIC

- Industrial clusters are struck simultaneously. Robots malfunction, chemical processes exceed safe limits, power systems trip and critical components stop reaching users. Disruption cascades through the economy

5

TRANSPORT

The Gridlock

DISRUPTIVE

- AI systems help malicious actors conduct cyberattacks on the digital nervous system of transport networks
- Railway signalling develops unexplained faults; airport systems receive fabricated flight information; ports misroute containers; traffic management systems break down

APOCALYPTIC

- A cluster of networks are compromised all at once, paralysing rail and air hubs, while ports and logistics hubs are shut down. Food, fuel and medicines stop moving. Cities are paralysed

"Our infrastructure being vulnerable, you cannot put **AI into equipment without thinking** it through"

ANSHUL GUPTA, *Advisor, RailTel*

care Statistics Reporting Service portal and accessed public and non-public files, calling the incident "unacceptable". Subsequently, OpenAI notified more than 100 organisations of incidents involving activity by its AI agents.

The Sam Altman-led OpenAI says it has been combing through roughly 50 petabytes of data to understand the full scope of its agents' unsanctioned activity post the Hugging Face breach, even as it works on a framework to codify safety practices for training frontier AI models. "There are two ways AI progress could go very badly, and that we must avoid. First, we could lose control of the future to AI," Altman said in a post on X on September 14, soon after rival Anthropic called for slowing down. "Second, we could end up in a world with too much concentration of power. If an extraordinarily powerful AI is used by one person or company to impress their worldview onto everyone else, the results could be extremely dystopian."
