only 7 per cent of Indian firms surveyed have these platforms in place today.

The urgency to evolve governance is becoming more evident among Indian enterprises. Seven out of 10 Indian executives say inadequate governance is holding back their ability to scale AI—underscoring that governance is no longer a back-end compliance exercise, but a front-line enabler of AI impact.

Evolving governance for an AI agent driven enterprise

Most organisations still approach governance as something external to the system, rules defined centrally, applied periodically. That separation is becoming harder to sustain. AI agents operate across data sources, systems and functions. As their footprint expands, visibility often does not. Many enterprises are still piecing together where AI is deployed, how decisions are made, and who is accountable for outcomes.

The implications go beyond risk. Without clear visibility and control, AI efforts remain fragmented. Scaling becomes difficult, outcomes inconsistent, and returns on investment harder to realise. Governance, therefore, must move closer to where decisions happen.

Orchestration-led AI governance brings governance and execution together through a control layer that coordinates models, agents and workflows. It embeds policies directly into the flow of operations, rather than applying them after the fact. As agents interact with each other and enterprise systems, orchestration platforms ensure alignment with business objectives. Organisations can monitor performance, intervene when required, and redirect outcomes in a controlled manner.

Responsible AI agents: governance as a business advantage

India's AI momentum is accelerating across sectors, while navigating increasing expectations around data sovereignty, compliance and trust. In this environment, AI governance is often seen as a constraint. In reality, when embedded into systems, it becomes an enabler of scale.

Orchestration-led governance allows enterprises to expand AI capabilities without losing control. It ensures that as agents operate across hybrid environments and interact with multiple systems, they remain aligned with enterprise policies and regulatory requirements in real time. It also strengthens resilience. With governance built into the architecture, organisations can adapt more effectively as systems evolve or external conditions change. Equally important, it builds trust, by making AI-driven decisions more transparent, consistent and accountable. This trust dividend is already visible—58 per cent of Indian executives say proper AI governance increases trust from customers, regulators and external partners in AI-driven outcomes—making governance a strategic lever not just for compliance, but for market credibility and stakeholder confidence.

For business leaders, the mandate is clear: don't treat AI governance as a compliance afterthought. Build it in from the start, as you scale AI agents across your enterprise. Invest in orchestration capabilities that give you real-time visibility and control, align governance with business outcomes, and empower teams to innovate with confidence. Those who lead with governance will not slow down—they will scale faster, earn greater trust, and turn AI from a set of experiments into a sustained competitive advantage. ■

TAKEAWAYS

- AI agents are becoming operational, moving into core business functions, making real-time decisions
- Orchestration-led governance embeds control into execution, helps enterprises guide and align AI agents across workflows
- Governance can be a competitive advantage. It builds trust, improves adoption and compliance, enables AI to scale responsibly
