continue to challenge an invention created by Abraham-Louis Breguet more than two centuries ago? For me, that diversity also says something important about Breguet today. We don't want to repeat the past; we want to continue what it started.

The Classique Tourbillon 7357 preserves the lineage of the Daniel Roth-era caliber 558, yet 41 percent of its components are new. Which elements were considered untouchable, and at what point does a revival become a new movement rather than an evolution?

We never approached the calibre by saying that certain components were untouchable. What we wanted to preserve was its character and its architecture. This movement has an important place in Breguet's history, particularly as our first Tourbillon calibre developed for a wristwatch.

But preserving its character doesn't mean leaving it unchanged. We reviewed it component by component and asked ourselves where we could genuinely improve it. In the end, almost half of the components are new, particularly to improve precision and bring the movement in line with today's Breguet standards.

For me, whether you call it an evolution or a new movement is less important than the result: you should still recognise where it comes from, but it should perform like a Breguet movement made today.

You are marking 225 years of the tourbillon one year after the 250th of the house itself. With two landmark anniversaries back to back, how do you keep each one feeling meaningful rather than routine, and what does the tourbillon specifically let you say that the 250th did not?

The two anniversaries tell quite different stories. The 250th anniversary was about Breguet as a whole: our history, of course, but also the direction we want to take for the future.

The 225th anniversary gives us the opportunity to focus on one invention and go much deeper. The Tourbillon is probably A.-L. Breguet's most famous invention, but what interests us is that, 225 years later, it is still a field for experimentation. We can rethink its construction, its materials, its weight, its position or even the way it is driven. So this anniversary is not simply about celebrating what happened in 1801. It is about asking what we can still do with that idea today.

The new Dent de Vaulion guilloché was inspired by the landscape surrounding the Vallée de Joux rather than drawn directly from Breguet's archives. Does this represent a conscious effort to create new Breguet visual codes, not simply preserve inherited ones?

Absolutely. Our archives are an extraordinary source of inspiration, but they cannot be our only source of inspiration. If A.-L. Breguet had only looked backwards, he would never have created what he did.

The Dent de Vaulion guilloché is a good example. It is created using a craft that is deeply rooted in Breguet, but the motif itself is new and inspired by the landscape surrounding us here in the Vallée de Joux. I like this idea very much: Keeping the savoir-faire, but giving our artisans and designers the freedom to create new expressions with it. The codes we consider historic today were once new themselves.
