

The Marine Tourbillon Équation Marchante 5887, with its celestial display; The Classique Tourbillon 7357 (Left)

The Marine Tourbillon Équation Marchante 5887 can recreate the night sky above any chosen place and moment, making its most complicated feature intensely personal. If you were commissioning one for yourself, which sky would you choose, and what memory would it preserve?

Difficult question! Probably my wedding day. As a father of two, I could not possibly choose just one! What makes this complication so special is precisely that it transforms something universal—the sky—into something so deeply personal.

We all look at the same stars, but associating a particular sky with a place and a moment gives it an entirely different emotional dimension. It becomes a memory you can wear on your wrist.

Breguet possesses one of watchmaking's richest histories, but heritage can become both an advantage and a creative constraint. Is there any tradition or established practice that Breguet must be willing to abandon to remain genuinely inventive?

We should not abandon a tradition simply for the sake of breaking with the past. But we must be prepared to question everything. The real danger with a history as rich as Breguet's would be to become too respectful of it—to the point where we are afraid to change anything. A. L. Breguet was an inventor. He challenged the conventions of his time constantly. So, in a way, being too conservative would probably be less faithful to his spirit than taking risks. There are codes we want to protect because they define Breguet, but the way we express them must continue to evolve.

You trained as a movement constructor before becoming a CEO. Can you recall a decision where the most technically impressive solution was not the best emotional or commercial choice for Breguet?

Many times. As an engineer, you naturally want to push a solution as far as technically possible. But I learned quite early that complexity alone does not make a great watch. Sometimes the best decision is actually to remove something. A technical solution may be fascinating on paper, but if it makes the watch thicker, less intuitive or compromises its proportions, you have to ask whether it really serves the product.

Today, I still look at watches with an engineer's eye, but as CEO I have to ask a different question: not simply "Can we do it?", but "Does it make the watch better?" Those are two very different things.

Breguet reaches Indian buyers today only through multi-brand retailers rather than your own boutiques. Where does India sit in a strategy built on owning your retail, and what would it take for Breguet to have a boutique there?

India is clearly a market we are watching with great interest. There is an appreciation for fine watchmaking, craftsmanship and history, which naturally creates an interesting environment for Breguet.

At the same time, our approach to retail is very deliberate. Opening a boutique is not simply about having an address in a market; it is about being able to offer the full Breguet experience, with the right location, the right team and, most importantly, a strong enough relationship with local clients.

For the moment, our multi-brand partners play an important role in India. If one day we feel that all the conditions are there to take the next step, then of course it is something we would consider. But we would rather do it at the right time and in the right way than simply open a boutique for the sake of being present.
